COMPRESSION SPRINGS WITH RECTANGULAR SECTION

1. SCOPE.

This standard lists the technical specifications for compression die springs made from generally rectangular or oval shaped wire.

The standard does not attempt to specify the quality of the springs; the specific dimensions of the O.D., I.D., or wire cross-section; the material; or the expected length of life.

The springs are classified into four load ranges: light, medium, heavy and extra heavy. See tables 2 through 5.

Conforms to ISO 10243.

2. TECHNICAL SPECIFICATIONS:

See figure 1.

FIGURE 1

3. Springs must fit, without binding, into hole sizes and over rod sizes as given in charts.

125	
150	

BULGE CURVE

To Use Chart:

1. Find maximum % deflection.
2. Read up to curve and over to bulge constant.
3. Multiply nominal O.D. by bulge constant to find O.D. at maximum stroke.

Example: 150 mm Spring @ 25% Compression

1. Find 25% deflection.
2. Read bulge constant at 1.15
3. Multiply 150 x 1.15 = 172 maximum diameter.

40			17,100	13,700	12,400
45				17,350	15,300

Grey areas are not recommended.

Recommendations based on:

$1.2 \leq FL/D \leq 1.75$; Deflection $\leq 0.3 FL$

NOTES & SPECIFICATIONS:

Mounting stud length must be accommodated by the designer.

* Stud body length must not exceed 50% of spring free length.

Dimension shown is max.
